Supplementary material

The entire analysis and figures presented in sections 3.1–3.4 are available as R script both on Zenodo at https://doi.org/10.5281/zenodo.4484122 and on GitHub at https://github.com/andreabz/psa_pb_ny-alesund.

Table S1. Pb concentration (pg/m^3), enrichment factors and Pb isotope ratio values for PM_{10} samples collected at Ny-Ålesund from 2010 to 2018. The entire dataset is available in electronic format at https://doi.org/10.5281/zenodo.4484136.

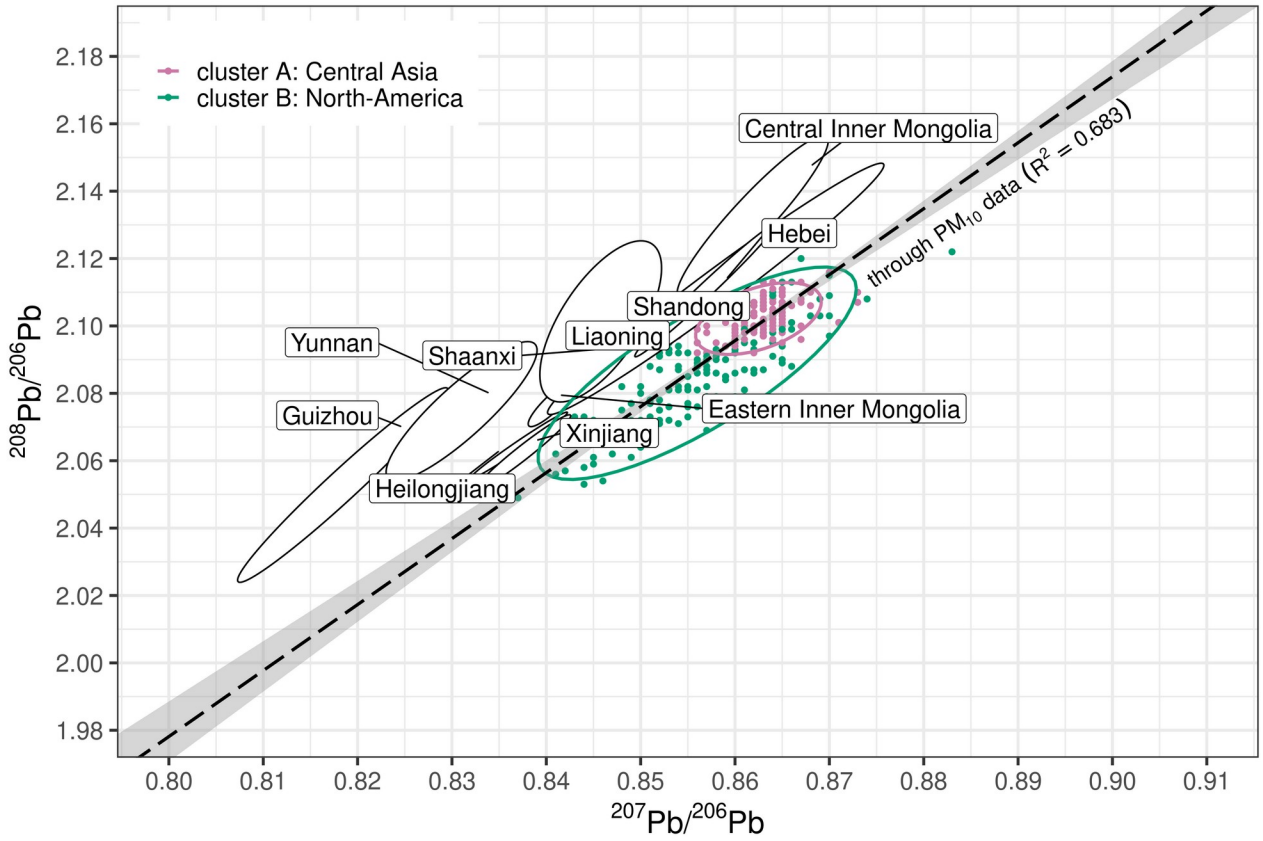

Figure S1: Three isotope plot for PM_{10} samples collected at Ny-Ålesund from 2010 to 2018, compared with Chinese coals. PM_{10} data are classified in two clusters according to the result of the Gaussian Mixture Modeling (GMM) for Pb isotope ratio values, enrichment factors (EFs) and Pb concentrations. The regression line for PM_{10} data was obtained by Deming regression, considering a relative uncertainty on $^{208}Pb/^{206}Pb$ values as twice that for $^{207}Pb/^{206}Pb$ values. Data for Chinese coals: (Bi et al., 2017). Black ellipses represent the 95% confidence interval of the mean for literature data.
